Abstract
Recently, mobile devices become more and more popular and lots of functions are added into. Because the capability of internet access on mobile device is common today, the limit of internet coverage is unrestricted now. Through wireless mobile devices, users could get the information all they need. However, the screen of mobile devices are so small that it is difficult to browse the web pages; moreover, while users are accessing internet through wireless networks, file transmission is often unstable.

In this paper, we propose a scheme to provide intelligent download suggestions for mobile learning contents using artificial intelligence. To deliver learning content via mobile devices, including PDA's, cell phones, pocket PCs, or other mobile devices, the file size must be considered. The success of downloading a large file depends on the Internet traffic at the moment. According to the induced decision tree, we can predict whether the downloading would be successful. If not, the server would suggest the user not to download the large file at the moment or to download an alternative file.

There are a lot of resources on the web. Through this system, we can browse these materials on each mobile device normally. Cooperate with the download suggestions, users will observe the correct information on their mobile devices in a minute. In the future, the system will develop more corresponding functions. It not only makes the web pages simple and clear, but also let users browse any information on moblie device easily.
