Abstract
Nowadays the stealing and fraud cases are still happened in on-line game. Some computer hackers, who use their computer knowledge to distribute the computer virus and Trojan horse program to collect profile information of users, assume users' game IDs collected to steal the treasure of game. These illegal problems suffer the game players.
This research is to introduce the new transaction scheme "contract transaction" into on-line game, which adopts the constraint of contract time into the exchange of game treasure to prevent player's treasure from being stolen. Game players don't necessarily worry about spending additional cost and complicated operation to protect their game treasure in on-line game, even the player's account is stolen and their game treasure being stolen by hackers. Using the proposed "contract transaction" scheme can automatically notice the game players to efficiently prevent their game treasure being stolen. Let game players can have the sufficiently secured time to check if the transaction is abnormal or regularly normal.
